

DevOps Fresher Roadmap (Senior Engineer Advice)

This roadmap is written from the perspective of a senior DevOps engineer advising a beginner who wants to get hired as a fresher in DevOps or Cloud Support roles in India. DevOps is not about coding heavily; it is about systems, reliability, automation, and mindset.

Phase 1: Foundations (Month 1)

1. Linux Fundamentals (Non-negotiable)

- File system navigation (ls, cd, pwd)
- File operations (cp, mv, rm)
- Permissions and ownership
- Process monitoring (top, ps)
- Log reading (cat, tail, grep)

2. Networking Basics

- IP address, DNS, HTTP/HTTPS
- Ports and firewalls
- Basic troubleshooting concepts

Phase 2: Cloud Fundamentals (Month 2)

Choose ONE cloud provider (Recommended: AWS)

- EC2: Virtual servers
- S3: Object storage
- IAM: Users, roles, permissions
- VPC: Basic networking understanding
- CloudWatch: Monitoring and logs

Focus on console usage first. CLI comes later.

Phase 3: DevOps Core Tools (Month 3)

1. Version Control (Git)

- Clone, commit, push, pull
- Basic branching

2. Containers (Docker)

- What containers are and why they are used
- Run containers
- Basic Dockerfile understanding

3. CI/CD Basics

- What CI/CD is
- Simple pipeline using GitHub Actions or Jenkins

Phase 4: Projects (Month 4)

Projects are mandatory. Without projects, resumes are rejected.

- Deploy a simple application on AWS using EC2 and Docker
- Build a CI/CD pipeline that auto-deploys on code commit
- Set up basic monitoring and alerts

Phase 5: Certification & Resume (Month 5)

- AWS Cloud Practitioner or AWS Solutions Architect Associate
- Create GitHub repo with project documentation
- Prepare resume focused on skills and projects, not buzzwords

Phase 6: Interview Preparation

- Explain how you would troubleshoot a server issue
- Explain Linux commands you use daily
- Explain your project architecture clearly
- Be honest about what you don't know

Senior Engineer Advice

DevOps is not about knowing everything. It is about learning fast, staying calm during failures, and improving systems over time. Break things in labs. Fix them. Document everything. That is how you become hireable.
